

V.H.F.
TRIODE PENTODE

GENERAL

This triode and variable mu pentode valve combination, with the pentode of frame grid construction, is for use in television tuners. It is primarily intended to be used as a variable gain V.H.F. frequency changer with the triode as local oscillator but the pentode is also designed for use as a high gain controlled I.F. amplifier following a U.H.F. tuner.

Heater Current	I_h	0.3	A
Heater Voltage	V_h	7.4	V

RATINGS

† With holder capacitance balanced out but with can. (Holder as below.)

△ Total capacitance including B9A ceramic holder with skirt and screening can (Plessey holder type CP180024/3).

“Earth” denotes the electrodes of the other section and the remaining earthy potential electrodes of the section under measurement, heater and shields joined to cathode.

CHARACTERISTICS

	Pentode	Triode	
Anode Voltage	V_a	125	V
Screen Grid Voltage	V_{g2}	125	V
Control Grid Voltage	V_{g1}	-1.5	V
Anode Current	I_a	10	mA
Screen Grid Current	I_{g2}	3.1	mA
Mutual Conductance	g_m	11	mA/V
Amplification Factor	μ	—	17
Inner Amplification Factor	μ_{g1-g2}	50	—

† Shield completely surrounds pentode.

Basing arranged to minimise pentode cathode lead inductance effects with the shorter lead to pin 8.

TYPICAL OPERATION AS FREQUENCY CHANGER AND I.F. AMPLIFIER

Grid current bias operation with A.G.C. Oscillator voltage injected into grid 1.

TYPICAL OPERATION AS FREQUENCY CHANGER AND I.F. AMPLIFIER

Partial grid current bias can be used for the frequency changer operation when a rectified voltage of greater than 8V d.c. is available from the triode grid resistor. This reduces the delay in the initial $V_{a.g.c.}/g_c$ characteristic as shown on page 12. The heterodyne voltage is injected into grid 1.
