CIRCUITS

Frequency changer circuits employing the DK91, for a medium and long wave receiver and for an all-wave receiver are given on page 3

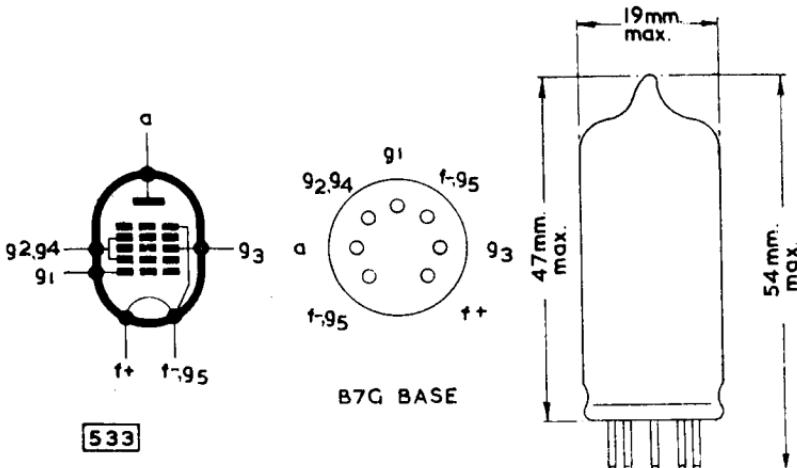

In these circuits—

C designates a decoupling capacitor.

L_c is a filament choke of $12 \mu\text{H}$ inductance and with a d.c. resistance of less than 0.5Ω .

L_b is the booster coil which should be designed to resonate in conjunction with its associated capacitor at a frequency just below the lower limit of the short wave band. For a receiver covering the range 5.8 to 18.7 Mc/s and having an intermediate frequency of 465 kc/s the booster circuit should resonate at 4.75 Mc/s. Suitable values are:
 $C=100 \mu\mu\text{F}$, $L_b=11 \mu\text{H}$.

L_h is the short wave coil and should have a Q of approximately 115 at 6.5 Mc/s.
