

Rectifying Valve Type U19

General. A directly heated half-wave rectifier with an oxide-coated cathode.

The valve is fitted with a 4-pin British base, the anode being connected to the top cap.

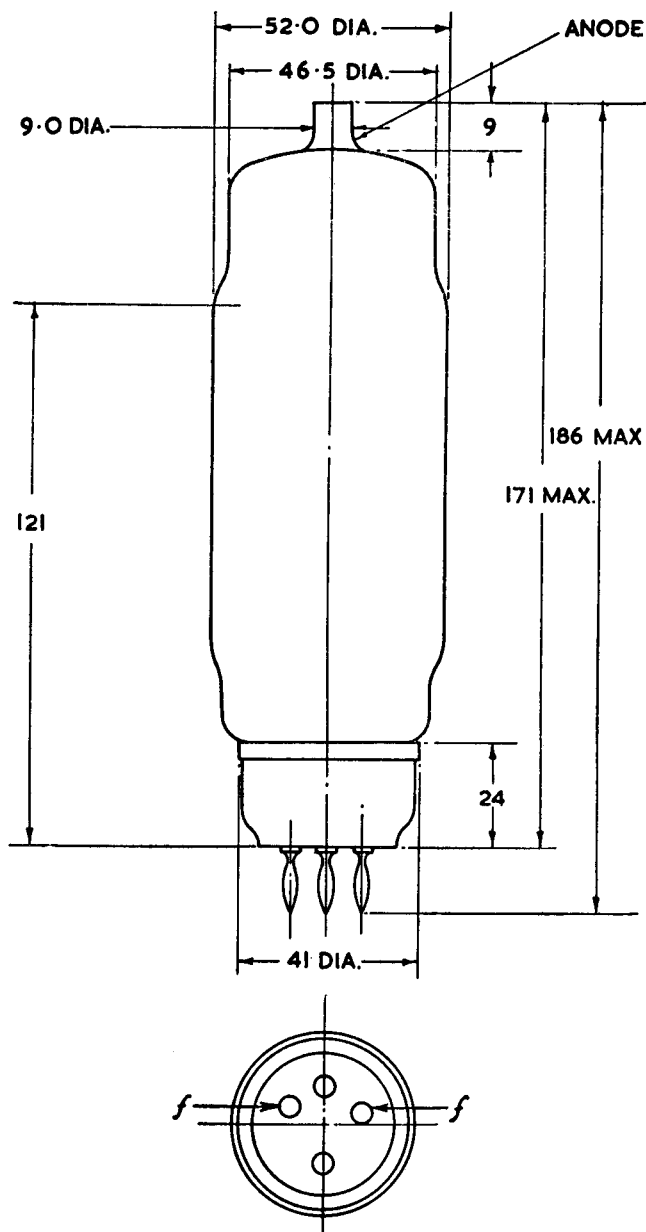

Mounting. The valves should be mounted in such a manner that they are not subjected to any undue mechanical shock or vibration. Vertical mounting is preferred, but if mounted horizontally the major axis of the valve filament should be vertical.

Precautions. (a) If the peak inverse voltage exceeds 5 kV the filament should be switched on for at least 20 secs. before the anode voltage is applied.

(b) Since valves of this type are often used in circuits having a low DC resistance, definite precautions must be taken to avoid accidental short circuiting of the load. A breakdown or flashover even of very short duration may cause destruction of the rectifier valves.
