## NOTES

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach $80 \%$ of its rated value after applying 4 times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to 3 times the rated heater voltage divided by the rated heater current.
2. Anode, Grid \#3 and Grid \#5 are connected together within the tube and are referred to herein as anode.
3. For visual extinction of the focused raster. For cutoff of the undeflected focus spot, the absolute value of the bias between cathode and grid will increase by about 5 volts.

DIAGRAM NOTES:
126

1. Reference line is determined by plane C-C' of JEDEC No. Reference Line Gauge, when the gauge is seated against the bulb.
2. Planes perpendicular to tube axis and passing through points $\mathbf{X}, \mathbf{Y}$ and $Z$ are located as follows:

Plane tangent to crown of face to plane of X: .758" Nom.
Plane of $X$ to plane of $Y=.463^{\prime \prime} \pm .030^{\prime \prime}$
Plane of $X$ to plane of $Z=.970^{\prime \prime} \pm .030^{\prime \prime}$
3. Dimensions are shown in inches.

## WARNING

X-ray radiation shielding may be necessary to protect against possible danger of personal injury from prolonged exposure at close range if this tube is operated at anode veltages higher than 18,000 volts.
